

Define Problem Statements

A Comprehensive Measure of Well-Being | HDI Predictor

Primary Problem

Researchers and policymakers lack a simple, fast tool to compute HDI scores without manually applying the UNDP formula across multiple indicators.

Problem Statement

How can we build a web application that allows users to input country-specific development indicators and instantly receive an accurate HDI score and tier classification?

Target Users

- Students studying economics and human development
- Policy researchers and analysts
- NGOs and government bodies
- General public curious about country development

Pain Points

- Complex UNDP formula hard to apply manually
- No simple interactive tool for HDI computation
- Lack of real-time feedback on indicator changes
- No visual tier classification for quick understanding
